

Design Decisions -

1. Keep it simple.
2. Use of [create-react-app](#) to bootstrap the app as I didn't need the server otherwise next would be a great choice.
3. Didn't see the need for a redux or react router either.
4. Application code has been organised in separate directories, especial mention to segregation of dumb and smart components in components and pages respectively.
5. Have used [material-ui/core](#) and [material-ui/icons](#) as a UI library.
6. Functional components throughout as they are concise and cleaner to write and test.
7. Use of react hooks (useReducer in main page)
8. Usage information is updated in [README](#).
